

Monitoring Inter-Carrier Voice over IP Services

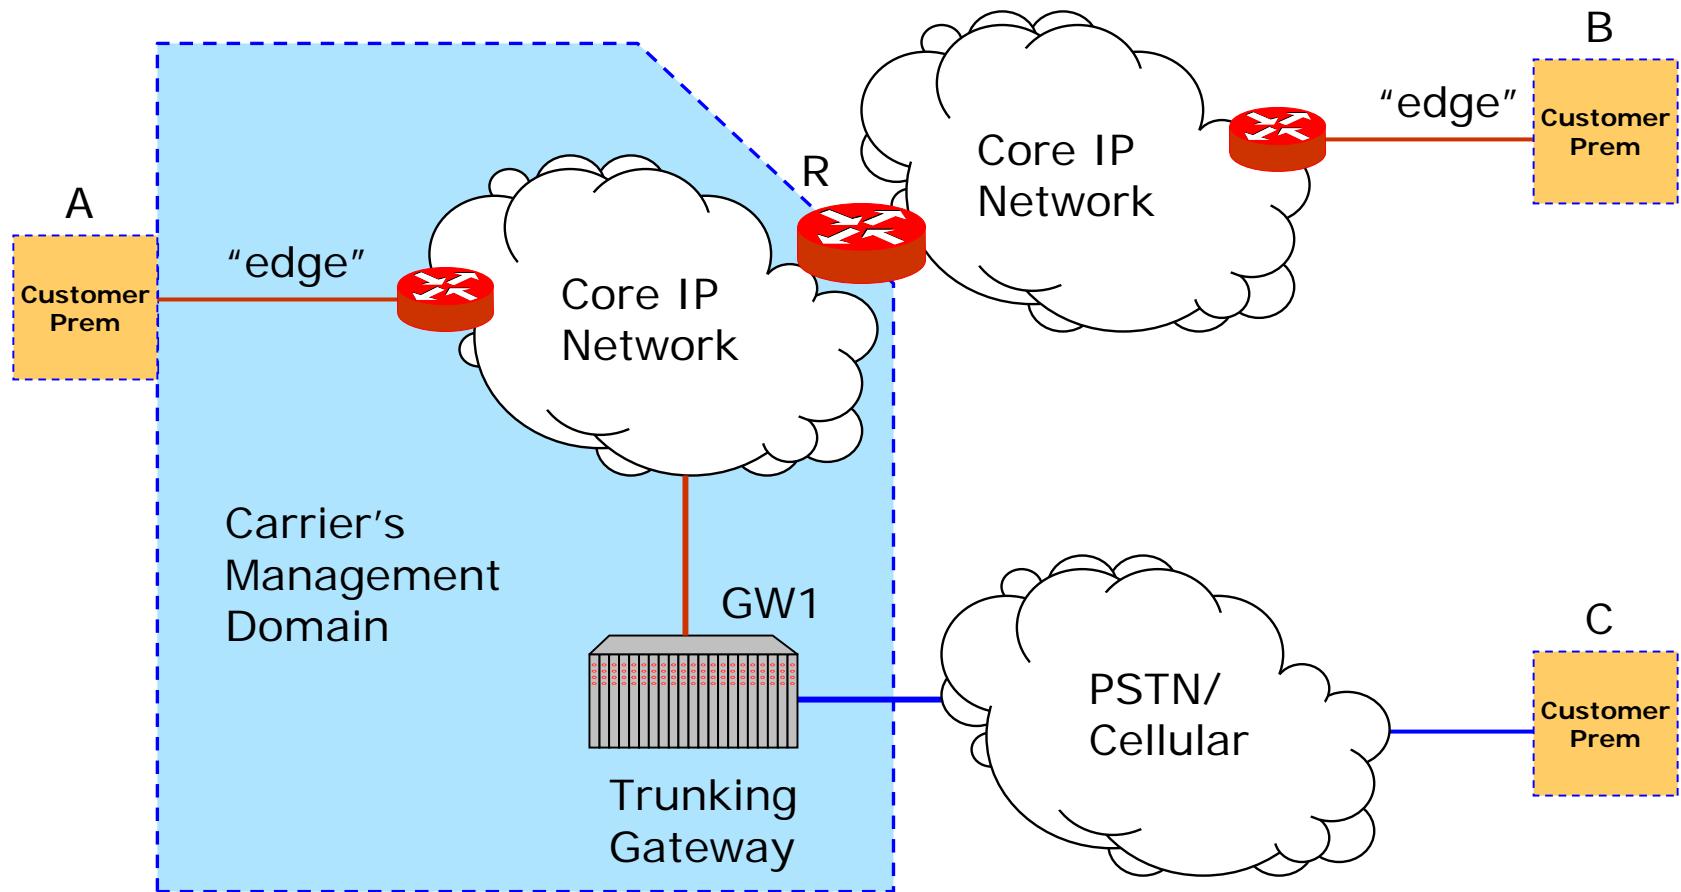

Alan Clark,
President & CEO
Telchemy, Incorporated

<http://www.telchemy.com>

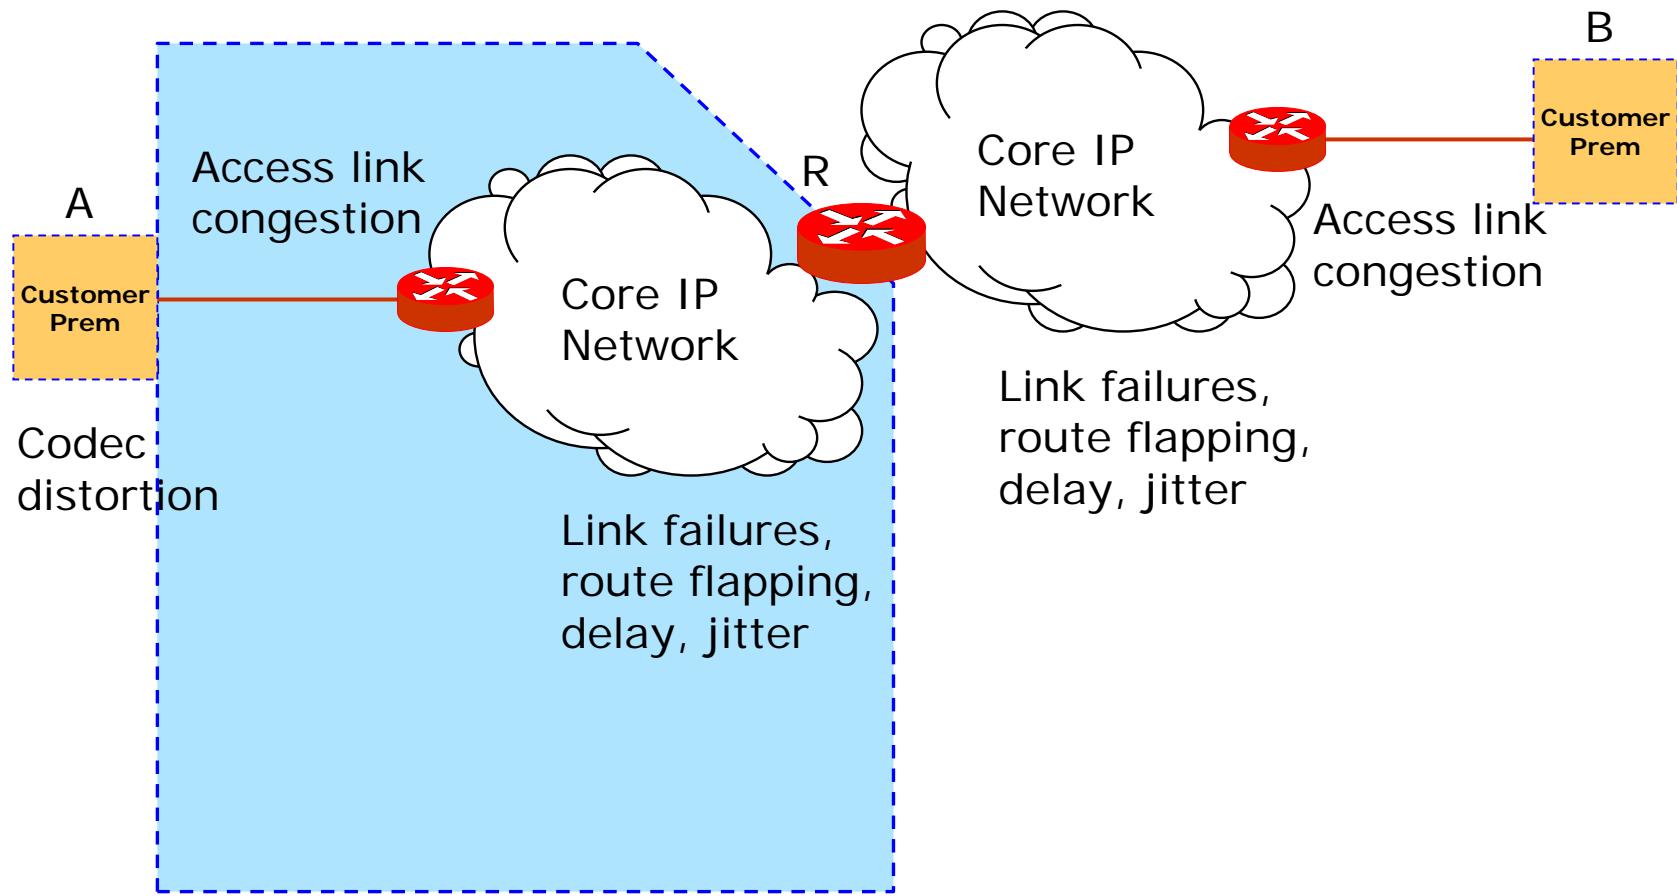

Outline

- Scenarios - VoIP-PSTN vs VoIP-IP
- Typical issues and problems
- Distributed service quality monitoring
- Application example

Inter-carrier Scenarios

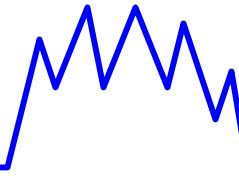

Inter-carrier Scenarios - VoIP-IP

IP Problems

Access Link
Congestion

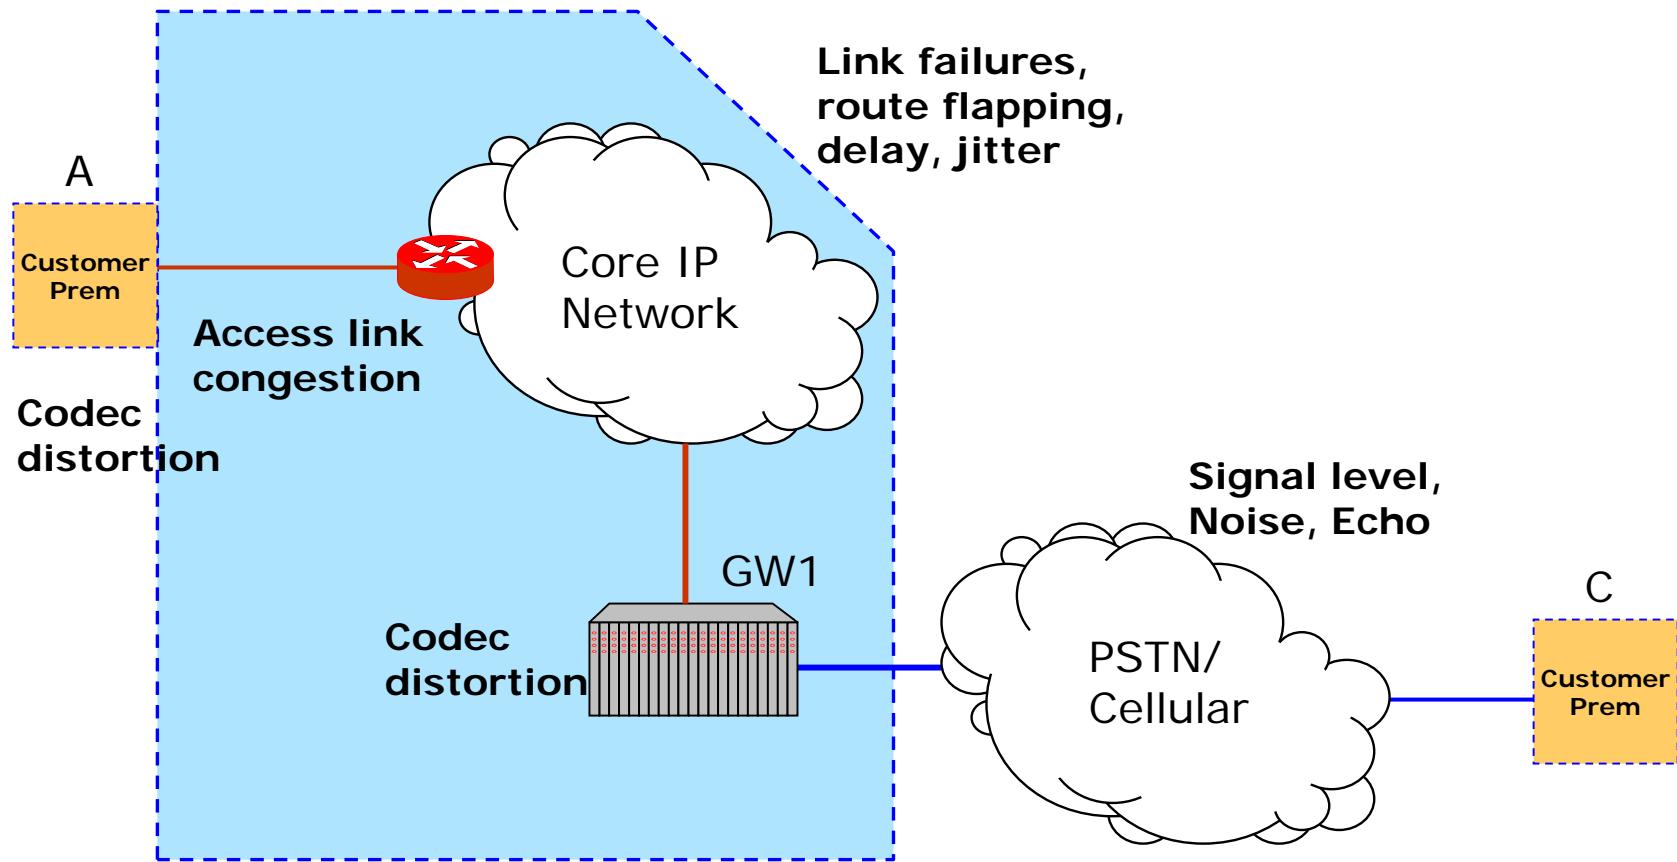

Link
Failures

IP Problems are Transient

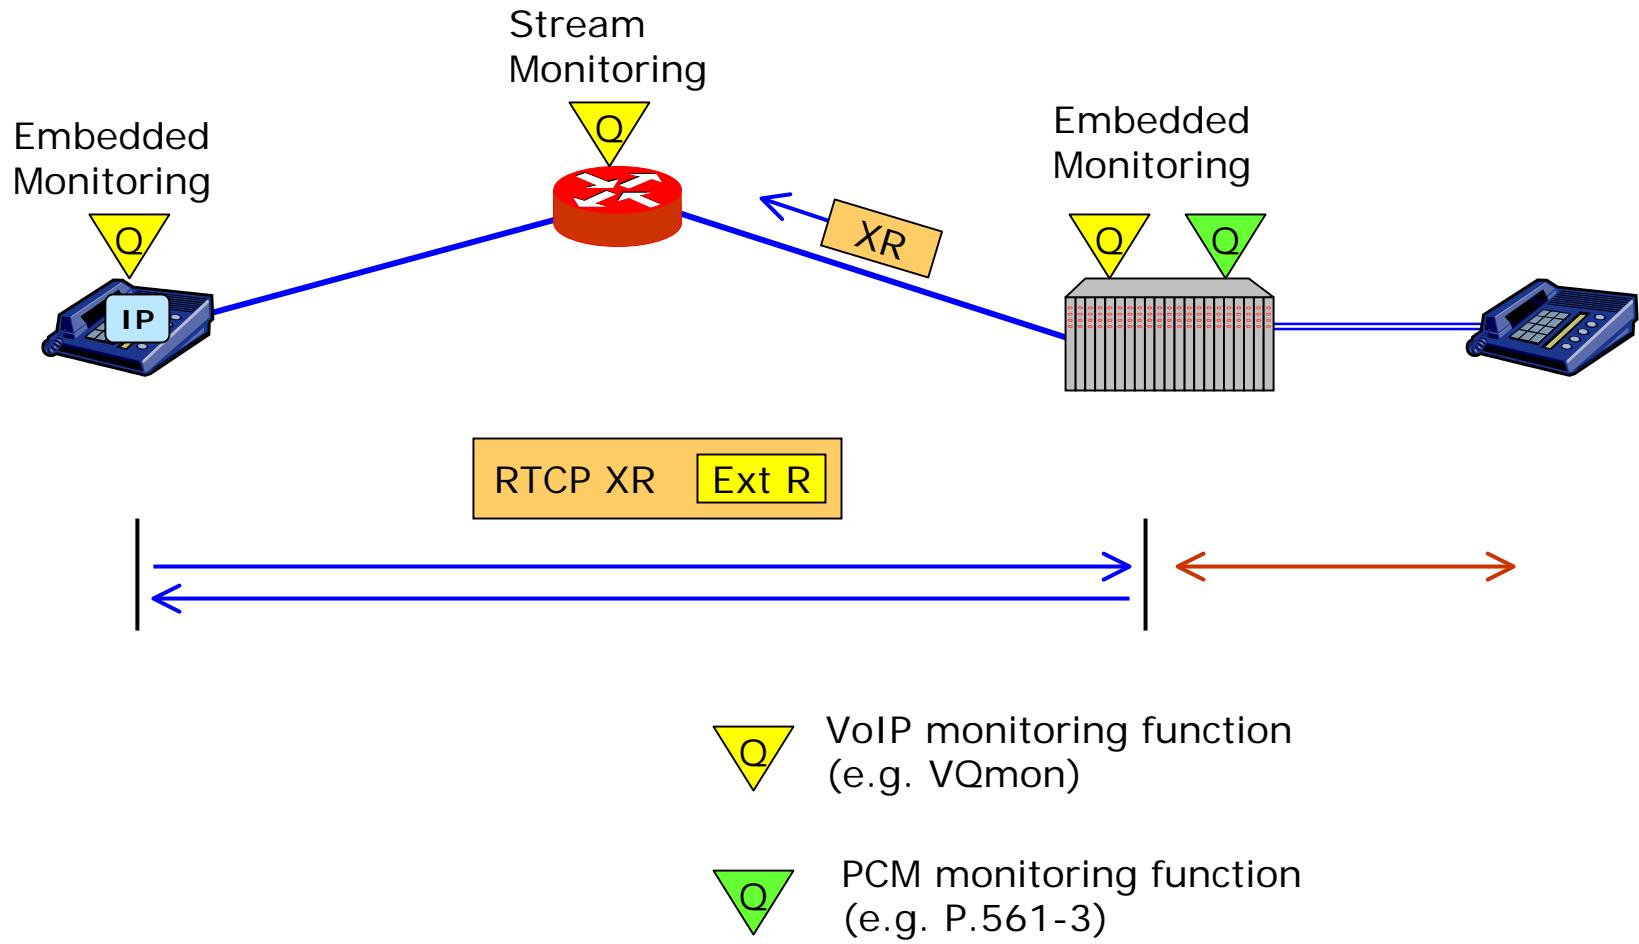

Inter-carrier Scenarios - VoIP-PSTN

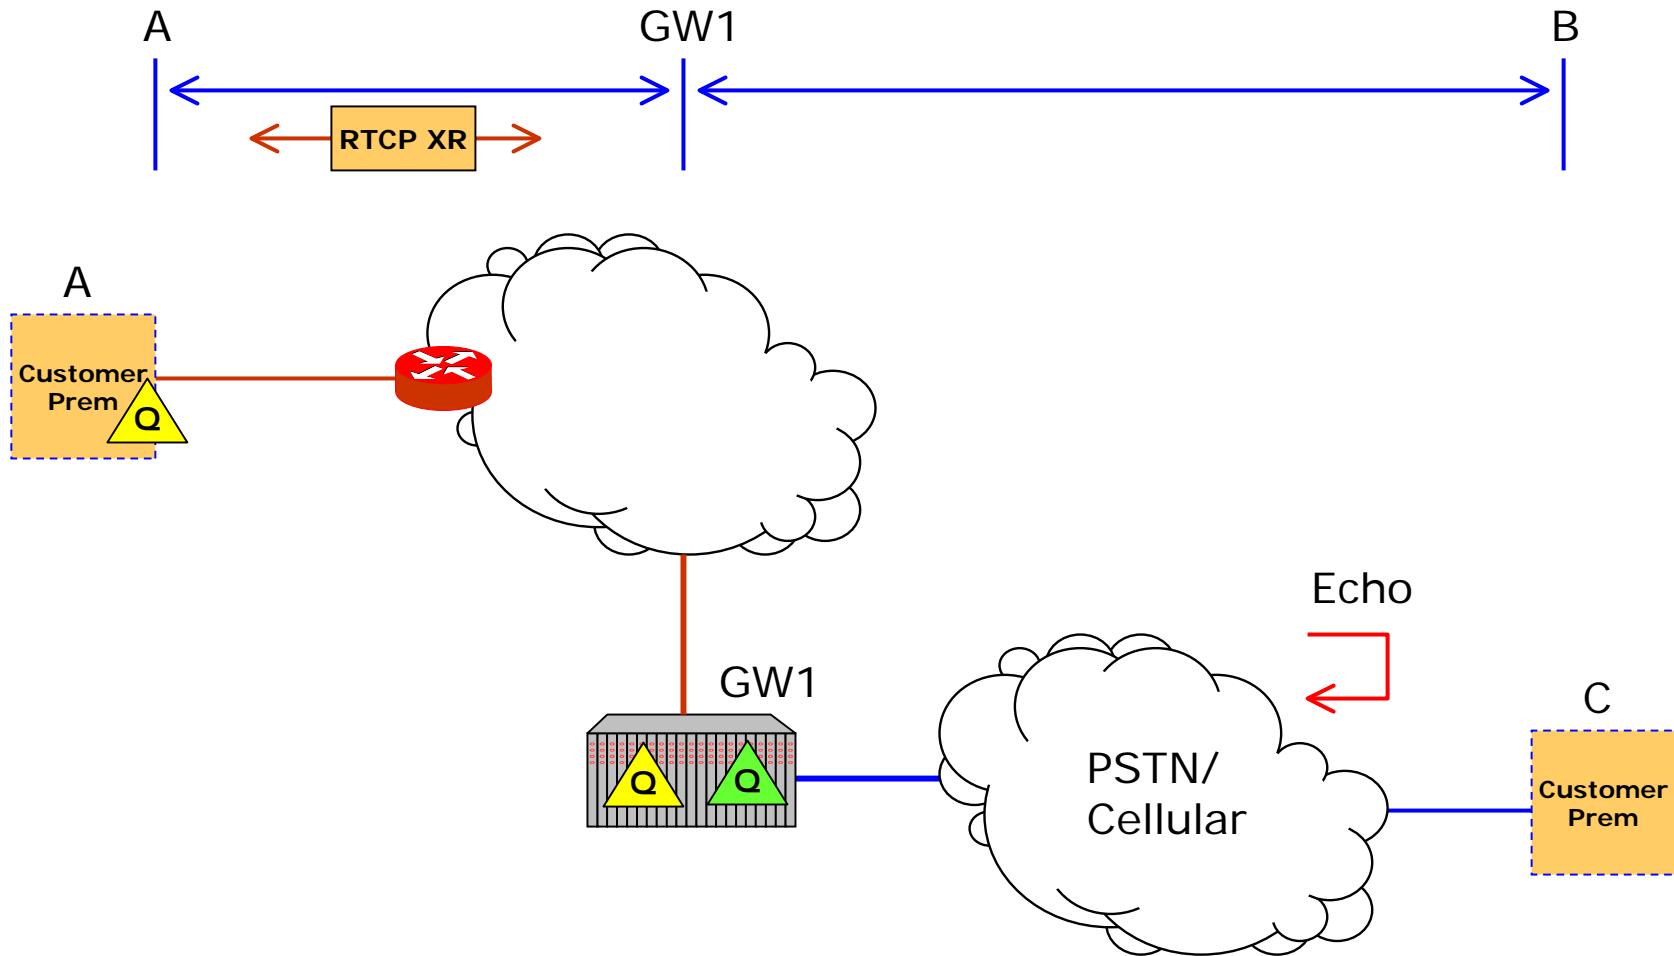

Added complexity

- IP problems are transient
- Can't just add-subtract aggregate statistics
- Impact of problem is often due to the collision of several factors (e.g. delay and echo)
- Need to monitor?
 - end-to-end quality or
 - end-demarc

Distributed performance monitoring

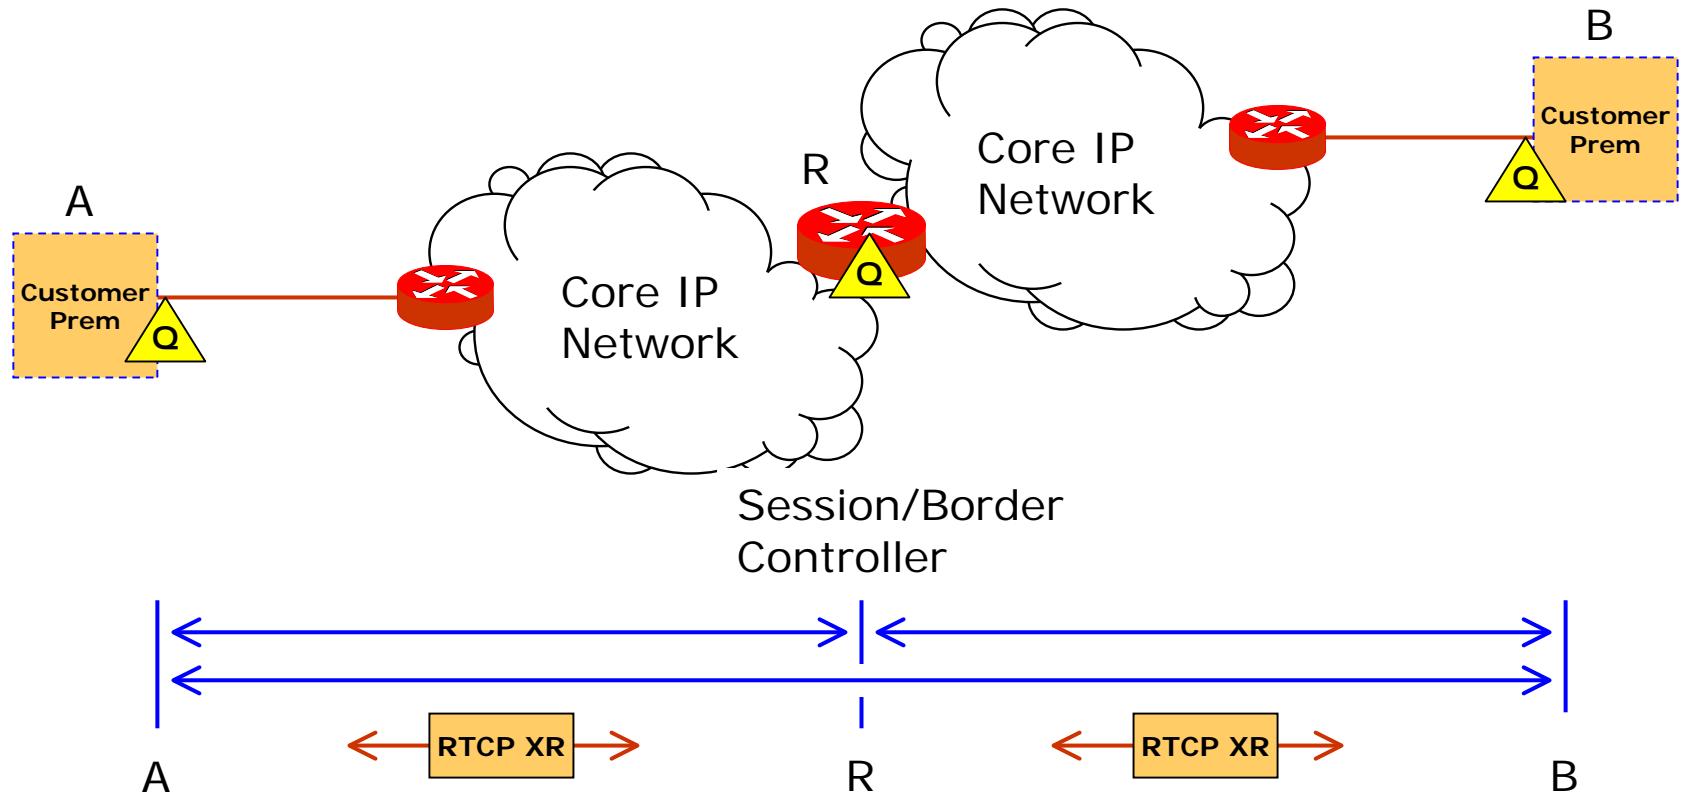

VoIP-PSTN Monitoring

VoIP-PSTN Monitoring

- Embedded monitoring function in Gateways
 - Has direct access to both packet and PCM data
- RTCP XR
 - provides end-to-end data exchange
 - supports diagnosis of loss plan and echo problems
- Signaling based reporting
 - End-of-call reporting via signaling system
 - Metrics based on RTCP XR
- SNMP - RTCP XR MIB

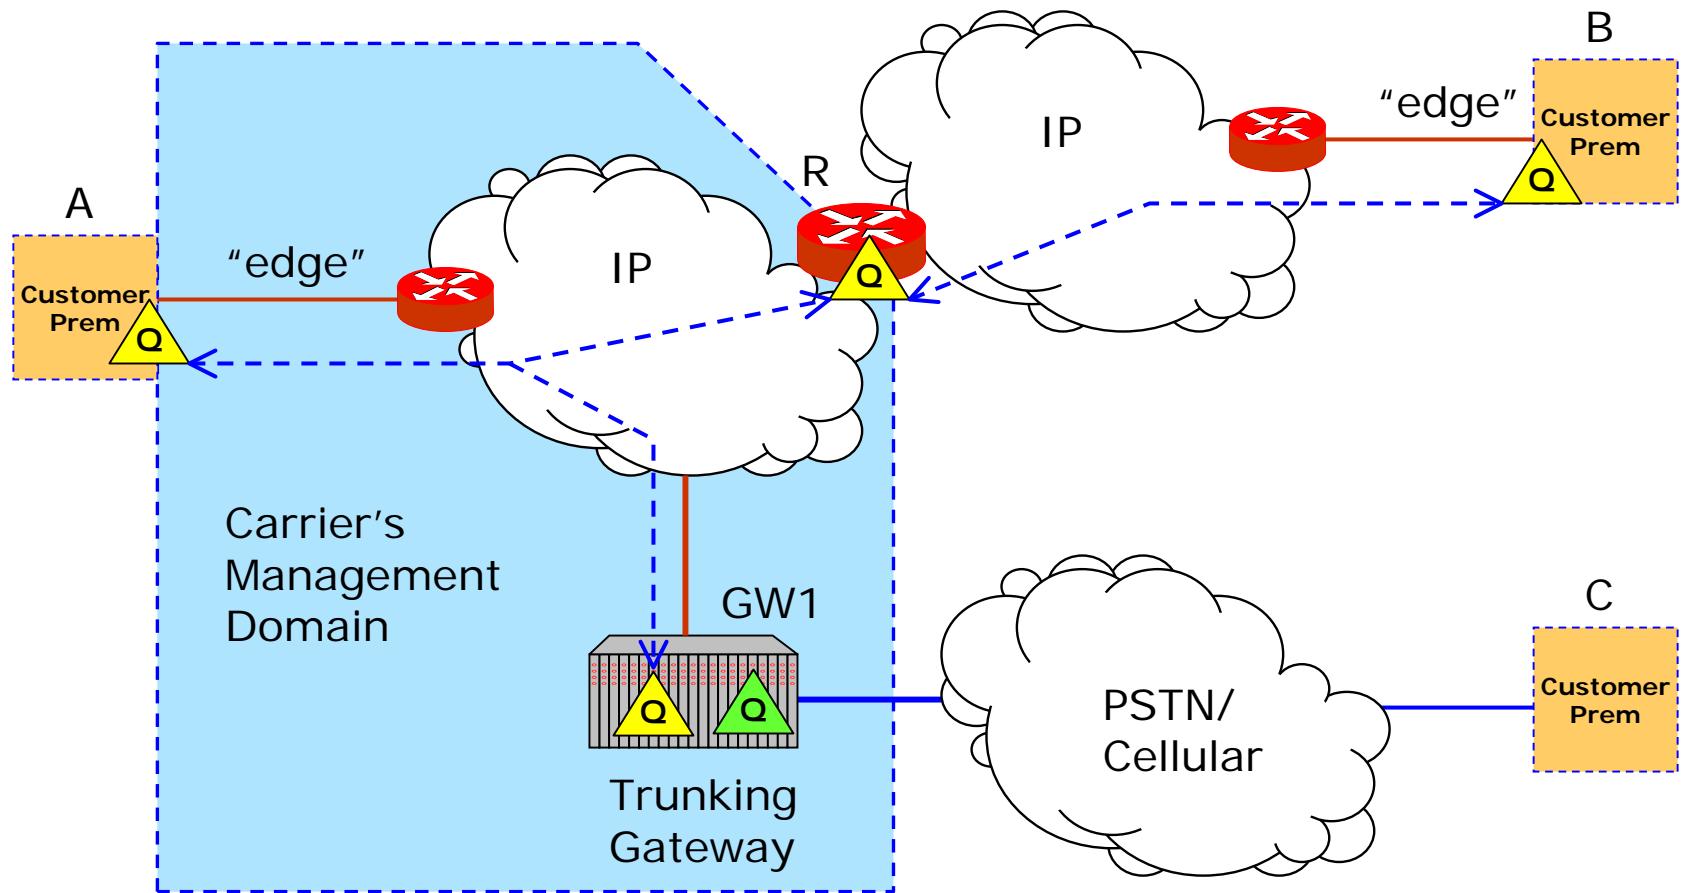

VoIP-IP Monitoring

VoIP-IP Monitoring

- Can monitor both endpoint to demarc and end-to-end call quality
- Session/Border Controller (SBC) is ideal location for monitoring function between service providers
- Embedded monitoring provides real time data from endpoints
- Use RTCP XR to provide:
 - SBC with access to endpoint provided data
 - Endpoint with feedback on endpoint-SBC path
 - Endpoint with feedback on endpoint-endpoint path

VoIP Performance Management Framework

Recommendations

- Use the VoIP Performance Management Framework
- Deploy RTCP XR in access gateways, trunking gateways, IP phones
- Deploy RTCP XR-aware mid-stream monitoring technology in Session/Border Controllers and probes
- Use passive monitoring for live traffic
- Use active testing for pre-deployment and on-demand troubleshooting
